

Model Optimization and Tuning Phase Report

Date	21 July 2024
Team ID	739680
Project Title	Estimating Presence or Absence of smoking through bio signals
Maximum Marks	10 Marks

Model Optimization and Tuning Phase

The Model Optimization and Tuning Phase involves refining machine learning models for peak performance. It includes optimized model code, fine-tuning hyperparameters, comparing performance metrics, and justifying the final model selection for enhanced predictive accuracy and efficiency.

Hyperparameter Tuning Documentation (6 Marks):

```
# Evaluate the performance of the tuned model accuracy = accuracy_score(y_test, y_pred) print(f'Optimal Hyperparameters: {best_params}') print(f'Accuracy on Test Set: {accuracy}')
KNN
                                                         knn_classifier = KNeighborsClassifier()
                                                         # Define the hyperparameters and their possible values for tuning
                                                         param_grid = {
                                                                                                                                                                                                     Optimal Hyperparameters: {'n_neighbors': 9, 'p': 1, 'weights': 'distance'}
Accuracy on Test Set: 0.7218934911242604
                                                                 'n_neighbors': [3, 5, 7, 9],
'weights': ['uniform', 'distance'],
'p': [1, 2]
                                                                                                                                                                                                    * Evaluate the performance of the tuned model accuracy = accuracy_score(y_test, y_pred) print(f'Optimal Myperparameters: {best_params}') print(f'Accuracy on Test Set: {accuracy}')
Gradient
                                                         # Define the Gradient Boosting classifier
                                                         gb_classifier = GradientBoostingClassifier()
Boosting
                                                         # Define the hyperparameters and their possible values for tuning
                                                                                                                                                                                                     Optimal Hyperparameters: {'learning_rate': 0.1, 'max_depth': 5, 'min_samples_leaf': 2, 'min_samples_split': 5, 'm_estimators': 200, 'subsample': 0.8}
Accuracy on Text Set: 0.79239480389337
                                                        param_grid = {
    'n_estimators': [50, 100, 200],
    'learning_rate': [0.01, 0.1, 0.2],
                                                                'max_depth': [3, 4, 5],
'min_samples_split': [2, 5, 10],
'min_samples_leaf': [1, 2, 4],
'subsample': [0.8, 1.0]
```

Performance Metrics Comparison Report (2 Marks):

Model	Optimized Metric					
Decision Tree	<pre>print(classification_report(y_test,y_pred))</pre>					
		precision	recall	f1-score	support	
	Loan will be Approved	0.67	0.68	0.68	75	
	Loan will not be Approved	0.74	0.73	0.74	94

Final Model Selection Justification (2 Marks):

Final Model	Reasoning
Gradient Boosting	The Gradient Boosting model was selected for its superior performance, exhibiting high accuracy during hyperparameter tuning. Its ability to handle complex relationships, minimize overfitting, and optimize predictive accuracy aligns with project objectives, justifying its selection as the final model.
